

Day 21 (03/12/2025)

File handling -

What is the file handling?

It will allow us to create, read, write & delete files.

It is used to store data permanently or temporarily.

The built-in function is `open()` to work with files.

Common modes:

- 1) "r" - read
- 2) "w" - write
- 3) "a" - append
- 4) "b" - binary
- 5) "t" - text
- 6) "rb" - read binary
- 7) "wt" - write text

File path -

relative path - Just a file name

absolute path - directories (complete location) + file name.

home → click on new file → demo.txt → open write something
→ open jupyter notebook → write `fl=open("demo.txt","r")` executed
this → `fl.read()` → after opening we have to close it so
`fl.close()`

`f1 = open("demo.txt", "r")`

`f1.read()` → for read what we write

'1 Hello everyone \n 2 Good evening'

`f1.close()` → after reading we have to close.

how to create a file in desktop?

Create a text file in desktop → then write and save some-

thing → click on copy as path → `f2 = open("paste the path", "r")`

this error will come → 'unicodeescape' codec can't decode

bytes in position 2-3: truncated \Uxxxxxx escape,

we have to put `r` before → `f2 = open(r"C:\Users\bhupa\`

OneDrive\Desktop\info.txt", "r") → then execute & read

`f2.read()`

→ `f2 = open(r"C:\Users\bhupa\OneDrive\Desktop\info.txt", "r")`

→ `f2.read()`

'Hii, this is Poojitha welcome back to my Youtube channel'

→ `f2.close()`

→ `f2.read()`

ValueError: I/O operation on closed file.

How to create a file in desktop from python (or) jupyter

when we wanted to create a file in desktop from

jupyter file `c1=open(filepath to desktop location, "w")`

write a code to create a text file in desktop:

```
c1 = open(r"C:\users\bhupa\OneDrive\Desktop\data.txt", "w")
```

```
c1.write("Hello good evening everyone")
```

```
c1.close()
```

→ for creating file

```
c2 = open(r"data.txt", "w")
```

```
c2.write("Hello good evening everyone")
```

```
c2.close()
```

→ writing something in file

```
c2 = open(r"data.txt", "a")
```

```
c2.write("please take your seat")
```

```
c2.close()
```

→ appending text in file.

for deleting

```
import os
```

```
os.remove("data.txt")
```
